The N-terminal of the alpha chain is unclear. The sequence shows homology to hHGF except between AAs 162 and 166 of this sequence which is absent from the TCF-II sequence. The DNA can be used to produce the TCF II by recombinant DNA technology. TCF II is an anticancer agent and induces differentiation of leukaemia cells, enhances cell-mediated immunity, and accelerates the proliferation of human blood vessel endothelial cells and hepatic parenchymal cells.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The sequence was deduced from a portion of HLC3, one of two clones, (for HLC2 see AAR15623) isolated from a cDNA library prepd. from mRNA extracted from human leukocytes, HLC2 has almost the same sequence as HLC3 except for five residues (162-166) in HLC2 which do not appear in HLC3. HLC3 shows similar characteristics to the human liver-derived HGF identified in Nature, 342, 440, 1898, but differs at 14 positions in the amino acid sequence. The DNA sequence can be expressed and the resulting protein, recombinant HGF, used in hepa- tocyte cultivation, liver regeneration, hepatocyte research, esp. into the mechanism of hepatoma, and to prepare anti-HGF antibodies for diagnosis and therapy. (Updated or 25-MAR-2003 to correct PI field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Recombinant human leukocyte-derived encoding it, recombinant expression

It has physiological activity, and using it enhanced growth of hepatocytes is possible. It is useful as a clinical diagnostic reagent, or a drug for treating hepatic disease.                                                                                          This sequence represents human tumour cytotoxic factor-II (TCF-II). TCF-II II has potent antitumour activity and growth stimulation activity. TCF-II is a member of the hepatocyte growth factor family (HGF). This sequence is used as an antigen to produce TCF-II specific antibodies that show no affinity to human HGF. The monoclonal antibody (MAb) was produced using hybridoma techniques. The MAbs were screened using solid phase EIISA with an increased selectivity. The MAb can be used for the selective determination or purification of TCF-II without any influence from the presence of HGF. The TCF-II can be used as an antitumour agent, a wound be the control of the selective to the selective can be used as an antitumour agent, a wound be the control of the selective to the selective can be used as an antitumour agent, a wound be the control of the selective can be used as an antitumour agent, a wound be a selective can be used as an antitumour agent, a wound be a selective can be used as an antitumour agent, a wound be a selective can be used as an antitumour agent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Monoclonal antibody to human tumour cytotoxic factor-II to human hepatocyte growth factor, is used for specific purification of TCF-II.

They protect cells from death (apoptosis) induced by chemotherapy of, e.g. tumors. In particular, they can be used for expansion of marrow precursors, to increase proliferation of the haematopoietic precursors or to stimulate their entry in the cycle. By modification of the proteolytic site, hybrid factors can be obtained which are activated by proteases of the endoplasmic reticulum (such as furines) during their synthesis. When the proteolytic site is removed, permanently immature forms of the factors can be obtained, having a potential partial agonistic or antagonistic activity. Different functional domains can be combined so as to modulate the biological
                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 729 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             and thereby induce biological responses which are synergistic and selective compared with the natural factor and truncated forms of the proteins. The portions of DNA encoding the various portions of alphabet-1 are obtained by PCR amplification of HGF or MSP cDNA and recombined to obtain a hybrid DNA (see AAX87676). Expression vectors, prokaryotic or eukaryotic host cells and a process for preparing recombinant proteins from HGF and MSP are claimed. Alphabet-1 and other HGF-MSP recombinant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This is the amino acid sequence of alphabet-1 factor, a recombinant protein composed of the hepatocyte growth factor (HGP) alpha chain (i.e. protein composed of the hepatocyte growth factor (HGP) alpha chain (i.e. the signal sequence, hairpin loop grotein (MSP) beta chain and a site of HGF, the macrophage stimulating protein (MSP) beta chain and a polyhistidine tag sequence. This structure allows the recombinant protein to interact with both the HGF receptor (Met) and the MSP receptor (Ron)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Example 1; Page 54-56; 63pp; English
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               chemotherapeutics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Recombinant proteins from recombination of HGF and MSP structural domains, useful for protecting cells against apoptosis induced by

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This is the amino acid sequence of alphabet-RTKR factor, a recombinant composed of the hepatocyte growth factor (HGF) alpha chain (i.e. the signal sequence, hairpin loop and kringles 1-4), a furine protease cleavage site, the natural cleavage site of HGF, the macrophage stimulating protein (MSP) beta chain and a polyhistidine tag sequence. This structure allows the recombinant protein to interact with both the HGF receptor (Met) and the MSF receptor (Ron) and thereby induce the HGF receptor (Met) and the MSF receptor (Ron) and thereby induce the loogical responses which are synergistic and selective compared with the natural factor and truncated forms of the proteins. The portions of the natural factor and truncated forms of the proteins. The portions of amplification of HGF or MSP cDNA and recombined to obtain a hybrid DNA (see AAX87677). Expression vectors, prokaryotic or eukaryotic host cells and a process for preparing recombinant proteins from HGF and MSP are claimed. Alphabet-RTKR and other HGF-MSP recombinant proteins are used for the prevention or treatment of chemotherapeutic-induced toxicity such

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Best Local Similarity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    as myelocoxicity, hepatotoxicity, nephrotoxicity, mucotoxicity and neurotoxicity (claimed). They protect cells from death (apoptosis) induced by chemotherapy of, e.g. tumors. In particular, they can be defor expansion of marrow precursors, to increase proliferation of the haematopoietic precursors or to stimulate their entry in the cycle. By modification of the proteolytic site, hybrid factors can be obtained which are activated by proteases of the endoplasmic reticulum (such as furines) during their synthesis. When the proteolytic site is removed, permanently immature forms of the factors can be obtained having a potential partial agonistic or antagonistic activity. Different functional domains can be combined so as to modulate the biological
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 729

The protein is particularly hepatitis B virus (HBV) surface antigen protein (HBsAg). The drugs of the invention demonstrate hepatotropic activity and may be useful for disease treatment, particularly in the therapy of liver diseases. The protein of the invention and subsequently the drug, has selectivity and specificity in targeting cells or tissues for delivering drugs fused with the specific nanoparticle-forming proteins, therefore, gene therapy can be achieved without needing surgery and with reduced side-effects. The current sequence is that of the chimeric HGF/HBsAg L
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Drugs comprising protein to form hollow nanoparticles with therapeutic substances encapsulated capable of recognizing target cells or tissues specifically and selectively, applicable in disease treatment.
                                                                                                                                                                                                                                                                                                                                                                   Sequence 1109

A cDNA clone was isolated and sequenced. The coding sequence can be incorporated into a plasmid and transformed into a microorganism for production of TCF-II. The protein itself can be used as a liver cell growth factor or a tumous cell killing factor. See also AAQ21067-9. (Updated on 25-MAR-2003 to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This is the amino acid sequence for human leukocyte-derived hepatocyte CC growth factor (HGF) HLC2, deduced from a CDNA clone (see AAV53627) CC obtained from a leukocyte cDNA library. Another leukocyte-derived HGF, CC HLC3 (see AAW59924), was identified that differs from HLC3 by having an CC extra 5 amino acid residues. A claimed method of producing a HGF CC comprises: transforming mammalian cells (preferably CHO cells) with a recombinant expression vector that has a promoter (preferably the SV40 CC early promoter), a gene coding for human leukocyte-derived HGF, and the CC dihydrofolate reductase gene; (b) culturing the transformed cells in the CC presence of successively elevated concentrations of methotrexate; and (c) CC recovering the HGF polypeptide from the culture supernatant. HGF CC polypeptides may be used as hepatocyte cultivation reagents, liver regeneration promoters, in basic research on liver function, research on the CC the action of various hormones and drugs on hepatocytes, research on the CC carcinogenesis mechanism of hepatoma, clinical diagnostic research on liver function, of the content of the polypeptide and therapeutic drugs for liver analthody against the polypeptide and therapeutic drugs for liver function, research on the content of the content of the polypeptide and therapeutic drugs for liver function.

Sequence 4, Application US/08605221

Patent No. 6699837

GENERAL INFORMATION:
APPLICANT: NAKAMURA, Toshikazu
TITLE OF INVENTION: THERAPBUTIC AGENT FOR DISORDER IN BRAIN
FILE REFERENCE: 2520-0101P
CURRENT APPLICATION NUMBER: US/08/605,221
CURRENT FILING DATE: 1996-03-15
NUMBER OF SEQ ID NOS: 4
SOFTWARE: Patentin Ver. 2.1
SEQ ID NO 4
LENGTH: 723
TYPE: PRT
ORGANISM: Homo sapiens
OTHER INFORMATION: HGF-B (five amino acids deletion type)
US-08-605-221-4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     RESULT 10

APPLICANT: MEDICO, Enzo et al.
TITLE OF INVENTION: Recombinant Proteins from HGI
FILE REFERENCE: 0471-0161.P
CURRENT APPLICATION NUMBER: US/09/601,040A
CURRENT FILING DATE: 2000-09-08
NUMBER OF SEQ ID NOS: 28
NUMBER OF SEQ ID NOS: 28
SOFTWARE: PatentIn version 3.0
SEQ ID NO 10
LENGTH: 723
TYPE: PRT
ORGANISM: Homo sapiens
US-09-601-040A-10
Sequence 2, Application US/09601040A
Patent No. 6730657
